Configuration Management. Improving process efficiency.

Configuration Management is an umlaut core competence. It usually starts with an in-depth check to identify the strengths and weaknesses of the CM (Configuration Management) system. By doing this, we can already implement quick wins and identify promising improvements. Furthermore, we can direct the development of CM systems, plans and processes or the integration of methods, training and eLearnings.

In the context of the digital transformation we automate manual tasks, apply data analytics and define product lifecycle management solutions. umlaut also takes operational responsibility to act as change leader, product structure responsible or conformity manager.

As a result, we improve our customers process efficiency and robustness, foster re-use and flexibility within their products and ensure compliance with the Aerospace CM requirements.
